

**MBA – MARKETING/FINANCE/HR/
PRODUCTION & OPERATIONS
MANAGEMENT (MBABM)**

Term-End Examination

December, 2014

00017

MBME-001 : ADVANCED CORPORATE FINANCE

Time : 3 hours

Maximum Marks : 100

Note :

- (i) *Section I is compulsory.*
- (ii) *In Section II, solve any five questions. All questions are based on the case Pelco given with the question paper.*
- (iii) *Assume suitable data wherever required.*
- (iv) *Draw suitable sketches wherever required.*
- (v) *Italicized figures to the right indicate maximum marks.*

SECTION I

1. We believe a portion of our cash flows should be paid to our shareholders as regular, sustainable, quarterly dividends. Currently, the Group pays a \$0.25 per share quarterly dividend. In the future, the dividend rate will depend on our cash flows, long-term capital requirements and overall capital structure.

As was the case in 1998, there likely will be periods when Georgia Pacific generates cash in excess of our opportunities for investments and dividends. Excess cash will be returned to our shareholders through share repurchases, so they can make their own reinvestment choices. We believe our long-term shareholders will benefit as their proportionate share of the Group grows.

Management is authorised to repurchase shares when total debt is below \$4.75 billion. During 1998, Georgia repurchased 7.7 million shares. This represents a tax efficient distribution of \$436 million to our shareholders and an 8% reduction from our January 1 share base.

Critically evaluate the dividend policy of Georgia Pacific. What considerations weighed before the management of Georgia Pacific when they formulated the above dividend policy ? What lessons can we draw from it ?

30

SECTION II
PELCO FOODS
COST OF CAPITAL OR
REQUIRED RATE OF RETURN

At first Daryl Waterfield was extremely pleased that the company's general manager, Trevor Unruh, had agreed to let him estimate the firm's cost of capital. Waterfield is one of Pelco's more innovative and thoughtful executives. A few years ago he correctly perceived that a successful firm in the food wholesalers industry would have to expand into non-food items. After extensive study Waterfield recommended that Pelco add such products as light hardware and paper plates to the variety of goods it sells to grocery stores. This strategy worked remarkably well. Pelco's customers benefitted because they dealt with fewer vendors and invoices. Pelco gained customers (many were referrals) and also reduced its unit cost by making more efficient use of its trucking capacity.

Waterfield has also developed an interest in the financial side of the business. During the past year he attended two seminars on cost of capital estimation, using his personal leave time and at his own expense. He has been eager to apply this newly acquired knowledge, and after a number of discussions Unruh told Waterfield to "determine Pelco's cost of capital and make a formal report on your findings." It seemed to

Waterfield that this was a major coup since Unruh paid little attention to the financial side of the business. He was told privately, however, that Unruh is "really unimpressed and bored with the entire idea; he assigned you this project because he knew you were eager to do it, and Unruh admires you and respects your initiative." Waterfield was told quite bluntly that "nothing will come of your efforts."

Initially deflated, Waterfield became more determined to do a thorough evaluation, and he felt sure he could convince Unruh of the importance of obtaining an accurate cost of capital. Pelco's management has philosophy of "better to be safe than sorry" when selecting a discount rate. At present the firm uses a 30 percent rate, which many company executives feel is unreasonably high. Waterfield believes that the result of such a high hurdle rate has been threefold. First, some projects considered to be worthwhile and important were rejected because their expected return was close to, but still below, the 30 percent minimum. Second, managers had a tendency to be overly optimistic in their cash flow projections to get their pet projects accepted. Third, there was a feeling, the rate was at best arbitrarily determined and at worst something Unruh "pulled out of a hat." Waterfield feels that all of these problems could be overcome with a more formal investigation of

the cost of capital. "At least," he thought, "it won't be so arbitrarily determined."

In preparation for making the estimate Waterfield reviewed his notes from one of the seminars he had attended. (See Exhibit 1) He recalled the instructor emphasizing that estimating the required return on equity was especially delicate; and although the instructor gave two models for measuring this return, he emphasized there was "no substitute for good judgment."

Waterfield also collected some financial information that he felt was relevant to the analysis. He knows the company has recently obtained a bank note at 10 percent and that the company's bonds were originally issued at 10 percent but are currently selling at a discount with a yield to maturity of about 12 percent.

Pelco's EPS has grown quite impressively in the last five years (See Exhibit 3), but Waterfield knows Unruh encouraged a relatively constant dividend per share over this period since he preferred to reinvest much of the company's earnings. Waterfield doesn't believe this will continue since Unruh is under pressure from major stockholders to bring dividend growth in line with earnings growth. Nor is it likely that past EPS growth can be maintained. First, during this period the industry itself had unusual prosperity. Second, some of this past

growth was a result of the firm's movement in to non-food items, and these opportunities are virtually exhausted. Third, many corporate insiders felt Pelco had been a bit lucky.

Waterfield decides it is reasonable to suppose that Pelco will implement a 60 percent payout ratio; after all, it makes no sense to retain a large proportion of earnings when investment opportunities are not as plentiful as in the past. He also feels that the company will achieve an average return of 18 percent on any retained earnings. Though these figures on payout and return are something of "guesstimates", Waterfield was able to find support for these numbers among Pelco's managers.

Most financial analysts consider the industry to be slightly below average in risk, and in fact, beta estimates for Pelco range from 0.7 to 0.9. Waterfield decides, however, that these estimates are a bit low, because the firm is in the process of altering production techniques that will cause the company's degree of operating leverage to increase.

And there is another difficulty. At present Pelco has no preferred stock in its capital structure. But Waterfield knows that there are plans to sell \$3 million of preferred stock in the next few months, though the price and dividend per share have not yet been determined. However, he does have some information on the preferred stock of

three of Pelco's competitors. (See Exhibit 6) These companies are much larger than Pelco and are considered less risky because they have a more diversified product line and customer base and enjoy a lower degree of operating leverage. He is also aware that the yield difference on the preferred stock of firms in roughly the same industry is 75 to 100 basis points.

"I've got quite a bit of information," Waterfield thought. "I hope I can put it all together to make a report that will impress Unruh."

EXHIBIT 1

Excerpts from Waterfield's Notes on the Cost of Capital Seminars

1. The instructor said cost of capital is really the *required rate of return* or hurdle rate that should be used to evaluate capital budgeting projects of average risk for the company. (Indeed, he much prefers the term "required rate of return" to the more common but potentially misleading "cost of capital.")
2. The cost of capital is a weighted average of the required return on each financing source. Theoretical accuracy requires these weights be obtained at the market values of debt, equity, and (if applicable) preferred stock. The instructor said, however, that most firms use book values because (1) it is easier, and (2) market values tend to vary widely.

3. The instructor recommended that all debt that does not require an explicit return be excluded when calculating the weights described in part 2. (Usually this means excluding accounts payable and accruals.)
4. The required return on each financing source should be based on current market conditions.
5. The instructor recommended that floatation costs be ignored. While theoretically incorrect this omission simplifies the calculations and does not significantly alter the estimate.

EXHIBIT 2

Historical Estimates of Yearly Returns on Various
Investments : 1926 – 1989

Investment	(Arithmetic Average) Average Yearly Return (%)
Common stocks	12.4
Small capitalization stocks	19.1
Long-term government bonds	4.9
Long-term corporate bonds	5.5

EXHIBIT 3
EPS and DPS Information on Pelco

Year	EPS	Change (%)	DPS	Change (%)
1985	\$0.73	—	\$0.40	—
1986	0.82	12.3	0.40	0
1987	1.14	39.0	0.40	0
1988	1.85	62.3	0.41	2.5
1989	2.35	27.0	0.43	4.9
1990 (present)	2.83	20.4	0.45	4.7

EXHIBIT 4
Financial Information Compiled by Waterfield

Treasury bill rate	8.5%
Long-term government bond rate	11%
Long-term corporate bond rate	12%
Current annual yield on Pelco's long-term debt	12%
Current dividend on Pelco's stock	\$0.45
Price range of Pelco's stock, previous year	\$21 - \$30
Rate on recent short-term loan (note)	10%
Pelco's tax rate	40%

EXHIBIT 5

Pelco's Financial Structure at Book Values (\$000s)

Accounts payable	45,000
Notes payable	16,000
Accruals and other current liabilities	8,000
Bonds	89,000
Common stock	58,000
Retained earnings	72,000
Total liabilities and equity	2,88,000

EXHIBIT 6

Preferred Stock Information on Pelco's Competitors

<i>Firm</i>	<i>Original Price of Preferred</i>	<i>Current Price of Preferred</i>	<i>Dividend</i>
Super Foods	\$50	\$40	\$4.00
Easton	\$41	\$31	\$3.25
Westgate	\$46	\$45	\$4.40

Questions :

2. Waterfield intends to adjust Pelco's beta estimates upwards in view of the fact that the firm's degree of operating leverage is increasing. Does such an adjustment seem appropriate? Explain.

14

3. Estimate Pelco's cost of capital. You may use book values in your calculations. Ignore preferred stock. The relevant tax rate is 40%. 14
4. Preferred stock is a riskier investment than bonds. Yet companies have been known to issue preferred stock at a lower yield than bonds. How can this happen, assuming investors are rational? 14
5. Pelco has long-term debt with a coupon rate of 10%, maturing in ten years. Determine the market value of this debt assuming a required rate of return of 12%. 14
6. The market value to book value ratio of equity is 1.15. Calculate the market value of Pelco's stock. Estimate Pelco's cost of capital based on market value. (Ignore preferred stock) 14
7. Which method of calculating the cost of capital is conceptually better – market values or book values? Why? 14
8. The 30% hurdle rate used by Pelco exceeds its cost of capital. How does that impact the company and its shareholders? What happens if the company errs in the other direction and chooses a hurdle rate less than its cost of capital? 14
