# POST GRADUATE DIPLOMA IN APPLIED STATISTICS (PGDAST) 

# Term-End Examination 

June, 2021

## MSTE-001 : INDUSTRIAL STATISTICS-I

## Time : 3 hours

Maximum Marks : 50

## Note :

(i) Question no. 1 is compulsory.
(ii) Attempt any four questions from the remaining questions 2 to 7.
(iii) Use of scientific calculator (Non-programmable) is allowed.
(iv) Use of Formulae and Statistical Tables Booklet for PGDAST is allowed.

1. State whether the following statements are True or False. Give reasons in support of your answers.
(a) From the control chart given below, we can conclude that the process has only chance causes.

Sample no.
(b) The OC curve for a sampling plan is a graph of the probability of rejecting a lot versus the proportion of defective units in the lot.
(c) For two-person zero-sum game having the following payoff matrix for player A :

|  |  | Player B |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | $\mathrm{B}_{1}$ | $\mathrm{~B}_{2}$ | $\mathrm{~B}_{3}$ |
| Player A | $\mathrm{A}_{1}$ | 1 | 2 | 6 |
|  | $\mathrm{~A}_{2}$ | 4 | 7 | 2 |
|  | $\mathrm{~A}_{3}$ | 3 | 5 | 10 |

Then the first row is dominated by the third row.
(d) In decision making process, if a vendor of newspapers has the following information :

| No. of Newspapers <br> Demanded | 300 | 400 | 500 | 600 |
| :--- | :---: | :---: | :---: | :---: |
| No. of Days | 40 | 100 | 40 | 20 |

Then the process of decision making is "decision making under certainty".
(e) If a reliability engineer has a system of three components which are connected as

then to improve the reliability of the system, he/she should concentrate to improve the reliability of the III component.
2. The branch manager of a bank wanted to study the waiting times of customers for issuing the Demand Draft during the peak hours ( 11 AM to 1.30 PM). Random samples of 4 customers were selected for 10 days and time (in minutes) was measured when each customer entered in the queue to when he/she began to be served. The results are given below :

| Sample No. | Time |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | $\mathrm{X}_{1}$ | $\mathrm{X}_{2}$ | $\mathrm{X}_{3}$ | $\mathrm{X}_{4}$ |
| 1 | 18 | 16 | 16 | 15 |
| 2 | 18 | 16 | 20 | 18 |
| 3 | 15 | 18 | 19 | 12 |
| 4 | 18 | 18 | 20 | 15 |
| 5 | 16 | 16 | 18 | 16 |
| 6 | 20 | 15 | 16 | 16 |
| 7 | 20 | 25 | 19 | 20 |
| 8 | 16 | 16 | 17 | 16 |
| 9 | 18 | 18 | 18 | 17 |
| 10 | 15 | 16 | 17 | 18 |

(i) Construct suitable control charts for variability as well as average time.
(ii) Draw conclusions about the process.
(iii) If process is out-of-control, calculate the revised control limits.
3. (a) A manufacturer of men's jeans purchases zippers in lots of 1000. A single sampling plan with sample size 15 is used and it is decided that if more than 2 zippers are found defective, the lot will be rejected. It is also decided that $\mathrm{AQL}=0.04$ and LTPD $=0 \cdot 12$. If there are $5 \%$ defective zippers in each lot, calculate the
(i) Probability of accepting the lot
(ii) Producer's risk
(iii) Consumer's risk
(iv) Average Outgoing Quality (AOQ), under acceptance and rectifying sampling plans. $2+2+1+1$
(b) Describe OC curve.
4. A two-person zero-sum game has the following payoff matrix for player A :

|  | Player B |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathrm{B}_{1}$ | $\mathrm{~B}_{2}$ | $\mathrm{~B}_{3}$ | $\mathrm{~B}_{4}$ |  |
| Player A | $\mathrm{A}_{1}$ | 3 | 2 | 4 | 1 |
|  | $\mathrm{~A}_{2}$ | 3 | 4 | 2 | 4 |
|  | $\mathrm{~A}_{3}$ | 4 | 2 | 4 | 1 |
|  | $\mathrm{~A}_{4}$ | 1 | 4 | 1 | 4 |

Solve the game using dominance rules. Is the game fair?
5. (a) The failure probability density function of a component is given by

$$
\mathrm{f}(\mathrm{t})=2 \mathrm{e}^{-2 \mathrm{t}} ; \mathrm{t}>0
$$

Find :
(i) Reliability function
(ii) Failure rate
(iii) Mean time to failure
(b) A standby system has four components which are connected as shown in the figure given below :

where component 1 is normally operating and components 2,3 and 4 are standby. The reliability of component 1 is $0 \cdot 80$. The reliability of component 2 given that component 1 has failed is 0.90 . The reliability of component 3 given that components 1 and 2 have failed is 0.70 and that of component 4 given that components 1,2 and 3 have failed is 0.60 . Evaluate the reliability of the system by considering that the switch is perfect.
6. (a) Evaluate the reliability of the system for which the reliability block diagram is shown in the figure given below :

Assume that components 9, 10 and 11 are not identical and at least two components of this group must be available for system success.
All other components are independent. The reliability of each is given as follows :
$\mathrm{R}_{1}=0 \cdot 6, \mathrm{R}_{2}=0 \cdot 6, \mathrm{R}_{3}=0 \cdot 6, \mathrm{R}_{4}=0 \cdot 6$,
$\mathrm{R}_{5}=0 \cdot 7, \mathrm{R}_{6}=0 \cdot 7, \mathrm{R}_{7}=0 \cdot 8, \mathrm{R}_{8}=0 \cdot 7$,
$\mathrm{R}_{9}=0 \cdot 7, \mathrm{R}_{10}=0 \cdot 8, \mathrm{R}_{11}=0 \cdot 9$,
where $R_{i}$ denotes the reliability of the $i^{\text {th }}$ component ( $i=1,2, \ldots, 11$ ).
(b) The following data give the payoff values (in thousand rupees) representing profits of a company :

| State of <br> Nature | Course of Action |  |  |
| :---: | :---: | :---: | :---: |
|  | $\mathrm{A}_{1}$ | $\mathrm{~A}_{2}$ | $\mathrm{~A}_{3}$ |
| $\mathrm{~N}_{1}$ | 1500 | 1800 | 2500 |
| $\mathrm{~N}_{2}$ | 2400 | 1600 | 2000 |
| $\mathrm{~N}_{3}$ | 1200 | 2000 | 3000 |

Identify the optimum course of action under each of the following approaches :
(i) Optimistic
(ii) Pessimistic
7. (a) A manufacturing process produces a certain type of bolts of average diameter 2 cm with an S.D. of 0.06 cm . Calculate the process capability. If the specification limits are $2.0 \pm 0.05$, is the manufacturing process capable of meeting the specification requirements?
(b) A manufacturer of buttons produces lots of 1000 buttons for shipment. A buyer uses a double sampling plan with $\mathrm{n}_{1}=5, \mathrm{c}_{1}=0$, $\mathrm{n}_{2}=20, \mathrm{c}_{2}=2$ to test the quality of the lots. If the incoming lot quality is 0.04 , what is the probability of accepting the lot on
(i) the first sample?
(ii) the second sample?
